Shocks on Earth

Shocks are...

- Caused by a collision between 2 different plasmas

- A hydrodynamic surprise:
one plasma is not "expecting" the collision

Entropy's tale

- $s_2 \geq s_1$
 - pre-shock must be supersonic
 - fluid goes from super- to sub-sonic
 - fluid slows down crossing shock
 - fluid **compresses** crossing shock

viscosity = 0 → $s_2 = s_1$

$$\frac{\partial}{\partial t} \left(\frac{1}{2} \rho v^2 + \frac{p}{\gamma - 1} \right) = -\nabla \cdot \left[\frac{1}{2} \rho v^2 \mathbf{v} + \frac{\gamma}{\gamma - 1} p \mathbf{v} + \vec{\sigma} \cdot \mathbf{v} \right]$$

viscosity does not appear in jump conditions (conservation laws) but it is necessary for transition from 1 to 2

Q: what goes wrong if we set $\mu = 0$?

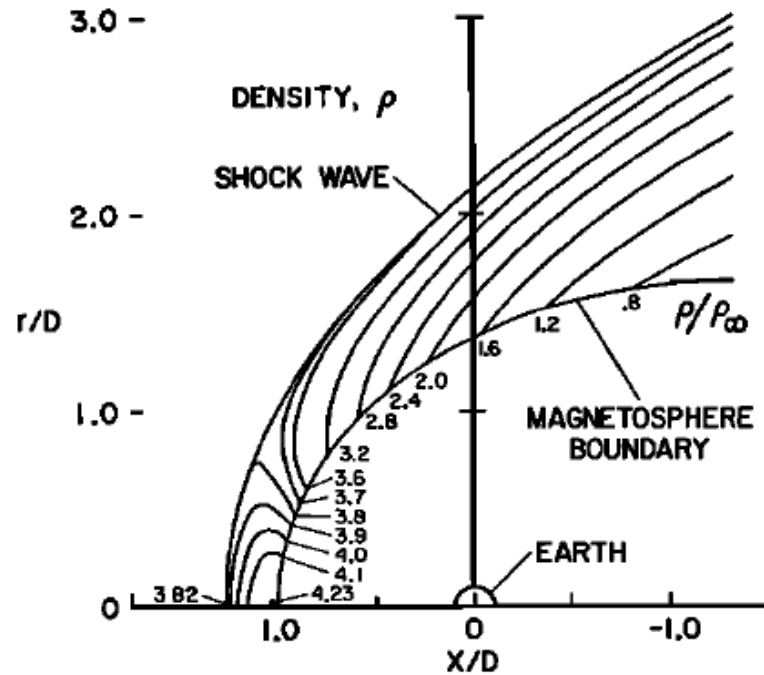

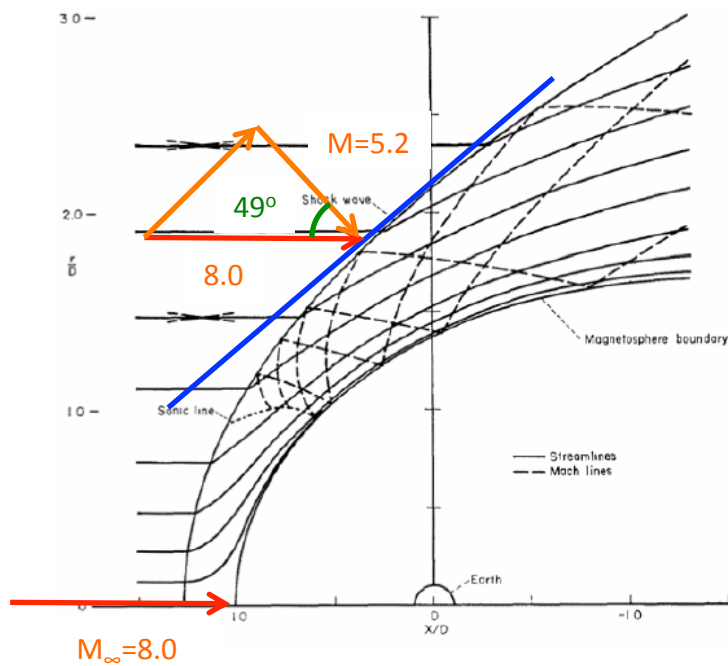

Q: is that diff. from taking $\mu \rightarrow 0$?

Entropy's Tale ... the sequel

- A shock converts kinetic to thermal energy
- How? What is the μ -physics?
 - Collisions (i.e. viscosity) – high enough density
 - Otherwise... (story not finished yet)
 - Instabilities, chaotic particle motion, ...
 - Related to acceleration of non-thermal particles
 - Easier if particles gyrate near shock:
quasi-perp. thermalizes easier than quasi-parallel
